About norms

2 Bregman distances

Mirror descent

Recap on (sub)-gradient descent

 \diamond When we used a norm $\|\cdot\|$ we meant the 2-norm, i.e.

$$||x||_2 = \sqrt{x_1^2 + x_2^2 + \dots + x_d^2}.$$

In gradient descent we used Lipschitz continuity:

$$\|\nabla f(x) - \nabla f(y)\| \le L\|x - y\|.$$

(Lead to a complexity of $\mathcal{O}(\frac{L}{k})$)

- ⋄ **Sub-gradient descent**: used $||g|| \le G$ which lead to $\mathcal{O}(\frac{G}{\sqrt{k}})$.
- \diamond But there are other norms $\|x\|_{\infty} \leq \|x\|_2 \leq \sqrt{d} \|x\|_{\infty}$ It can happen that $\|g\|_{\infty} \leq G$ but $\|g\|_2 \approx \sqrt{d}G$.

we lose dimension independence

we lose dimension independence

Different norms?

But where did we use the norm in the **method**?

Gradient Descent

$$x_{k+1} = x_k - \alpha \nabla f(x_k)$$

equivalently

$$x_{k+1} = \operatorname*{arg\,min}_{x \in \mathbb{R}^d} \left\{ f(x_k) + \langle \nabla f(x_k), x - x_k \rangle + \frac{1}{2\alpha} \|x - x_k\|_2^2 \right\}$$

We can replace the 2-norm with a more general distance.

Bregman distance

- (i) $h: \mathbb{R}^d \to \mathbb{R} \cup \{+\infty\}$ is convex
- (ii) h is differentiable on the interior of dom h
- (iii) h is 1-strongly convex (w.r.t. given norm $\|\cdot\|$)

$$\mathcal{D}_h(x,y) := h(x) - h(y) - \langle \nabla h(y), x - y \rangle.$$

Properties

- \diamond nonnegative: $\mathcal{D}_h(x,y) \geq 0$
- \diamond not necessarily symmetric: $\mathcal{D}_h(x,y) \neq \mathcal{D}_h(y,x)$
- From Taylor expansion we see

$$\mathcal{D}_h(x,y) \approx \frac{1}{2} \langle \nabla^2 h(y)(x-y), x-y \rangle = \frac{1}{2} ||x-y||_{\nabla^2 h(y)}^2$$

 $\Diamond \mathcal{D}_h(x,y) \geq \frac{1}{2} ||x-y||^2$ (1-strong convexity)

Bregman distance

- (i) $h: \mathbb{R}^d \to \mathbb{R} \cup \{+\infty\}$ is convex
- (ii) h is differentiable on the interior of dom h
- (iii) h is 1-strongly convex (w.r.t. given norm $\|\cdot\|$)

$$\mathcal{D}_h(x,y) := h(x) - h(y) - \langle \nabla h(y), x - y \rangle.$$

Properties

- \diamond nonnegative: $\mathcal{D}_h(x,y) \geq 0$
- \diamond not necessarily symmetric: $\mathcal{D}_h(x,y) \neq \mathcal{D}_h(y,x)$
- ⋄ From Taylor expansion we see

$$\mathcal{D}_h(x,y) \approx \frac{1}{2} \langle \nabla^2 h(y)(x-y), x-y \rangle = \frac{1}{2} \|x-y\|_{\nabla^2 h(y)}^2.$$

 $\diamond \mathcal{D}_h(x,y) \ge \frac{1}{2} ||x-y||^2$ (1-strong convexity)

Examples

$$\phi \ h(x) = \frac{1}{2} ||x||_2^2 \text{ gives } \mathcal{D}_h(x, y) = ||x - y||^2$$

$$h(x) = \frac{1}{2(p-1)} ||x||_p^2 \text{ with } p \in [1,2]$$

 $\diamond \ \Delta^d = \{x \in \mathbb{R}^d_+ : \sum_{i=1}^d x_i = 1\}$ the *unit simplex* and

$$h(x) = \begin{cases} \sum_{i=1}^{d} x_i \log(x_i) & x_i > 0 \\ +\infty & \text{otherwise} \end{cases}$$

the Negative entropy.

Negative entropy

- \diamond Negative entropy: $h(x) = \sum_{i=1}^{d} x_i \log(x_i)$ for $x_i > 0$.
- \diamond Then $\nabla h(x) = \log(x) + 1$ (coordinatewise) and

$$\mathcal{D}_h(x,y) = \sum_{i=1}^d x_i \log(x_i) - y_i \log(y_i) - \langle \log(y) + 1, x - y \rangle$$

$$= \sum_{i=1}^d x_i \log(x_i) - \sum_{i=1}^d x_i \log(y_i)$$

$$= \sum_{i=1}^d x_i \log\left(\frac{x_i}{y_i}\right)$$

Known as Kullback-Leibler divergence K(X||Y).

 \diamond Is strongly convex over Δ

$$\mathcal{D}(x,y) \ge \frac{1}{2} \|x - y\|_1^2$$
 Pinsker's ineq.

Mirror descent

Idea: replace squared Euclidian norm with more general object:

$$\begin{aligned} x_{k+1} &= \underset{x \in \mathbb{R}^d}{\text{arg min}} \{ f(x_k) + \langle \nabla f(x_k), x - x_k \rangle + \frac{1}{\alpha} \mathcal{D}_h(x, x_k) \} \\ &= \underset{x \in \mathbb{R}^d}{\text{arg min}} \{ \langle \nabla f(x_k), x \rangle + \frac{1}{\alpha} \mathcal{D}_h(x, x_k) \} \\ &= \underset{x \in \mathbb{R}^d}{\text{arg min}} \{ \langle \nabla f(x_k), x \rangle + \frac{1}{\alpha} (h(x) - h(x_k) - \langle \nabla h(x_k), x - x_k \rangle) \} \\ &= \underset{x \in \mathbb{R}^d}{\text{arg min}} \{ \langle \nabla f(x_k), x \rangle + \frac{1}{\alpha} (h(x) - \langle \nabla h(x_k), x \rangle) \} \\ &= \underset{x \in \mathbb{R}^d}{\text{arg min}} \{ \langle \alpha \nabla f(x_k) - \nabla h(x_k), x \rangle + h(x) \} \end{aligned}$$

Question: But why mirror descent?

Mirror descent

Idea: replace squared Euclidian norm with more general object:

$$\begin{aligned} x_{k+1} &= \underset{x \in \mathbb{R}^d}{\text{arg min}} \{ f(x_k) + \langle \nabla f(x_k), x - x_k \rangle + \frac{1}{\alpha} \mathcal{D}_h(x, x_k) \} \\ &= \underset{x \in \mathbb{R}^d}{\text{arg min}} \{ \langle \nabla f(x_k), x \rangle + \frac{1}{\alpha} \mathcal{D}_h(x, x_k) \} \\ &= \underset{x \in \mathbb{R}^d}{\text{arg min}} \{ \langle \nabla f(x_k), x \rangle + \frac{1}{\alpha} (h(x) - h(x_k) - \langle \nabla h(x_k), x - x_k \rangle) \} \\ &= \underset{x \in \mathbb{R}^d}{\text{arg min}} \{ \langle \nabla f(x_k), x \rangle + \frac{1}{\alpha} (h(x) - \langle \nabla h(x_k), x \rangle) \} \\ &= \underset{x \in \mathbb{R}^d}{\text{arg min}} \{ \langle \alpha \nabla f(x_k) - \nabla h(x_k), x \rangle + h(x) \} \end{aligned}$$

Mirror descent

Idea: replace squared Euclidian norm with more general object:

$$\begin{aligned} x_{k+1} &= \underset{x \in \mathbb{R}^d}{\text{arg min}} \{ f(x_k) + \langle \nabla f(x_k), x - x_k \rangle + \frac{1}{\alpha} \mathcal{D}_h(x, x_k) \} \\ &= \underset{x \in \mathbb{R}^d}{\text{arg min}} \{ \langle \nabla f(x_k), x \rangle + \frac{1}{\alpha} \mathcal{D}_h(x, x_k) \} \\ &= \underset{x \in \mathbb{R}^d}{\text{arg min}} \{ \langle \nabla f(x_k), x \rangle + \frac{1}{\alpha} (h(x) - h(x_k) - \langle \nabla h(x_k), x - x_k \rangle) \} \\ &= \underset{x \in \mathbb{R}^d}{\text{arg min}} \{ \langle \nabla f(x_k), x \rangle + \frac{1}{\alpha} (h(x) - \langle \nabla h(x_k), x \rangle) \} \\ &= \underset{x \in \mathbb{R}^d}{\text{arg min}} \{ \langle \alpha \nabla f(x_k) - \nabla h(x_k), x \rangle + h(x) \} \end{aligned}$$

Question: But why mirror descent?

The Mirror part

$$x_{k+1} = \arg\min_{x \in \mathbb{R}^d} \{ \langle \alpha \nabla f(x_k) - \nabla h(x_k), x \rangle + h(x) \}$$

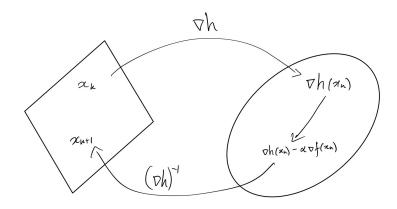

By optimality condition:

$$0 = \alpha \nabla f(x_k) - \nabla h(x_k) + \nabla h(x_{k+1})$$

Therefore

$$\nabla h(x_{k+1}) = \nabla h(x_k) - \alpha \nabla f(x_k)$$

Why it's called mirror descent

Mirror Descent w.r.t. negative entropy

Negative entropy: $h(x) = \sum_{i=1}^{d} x_i \log(x_i)$ for $x_i > 0$.

We define $a := \alpha \nabla f(x_k) - \nabla h(x_k)$. Then

$$x_{k+1} = \underset{x \in \Delta}{\operatorname{arg min}} \{ \langle a, x \rangle + h(x) \}$$

Results in

$$x_{k+1} = x_k. * e^{-\alpha \nabla f(x_k)}$$

in a componentwise sense.

$$x_{k+1}[i] = x_k[i]e^{-\alpha[\nabla f(x_k)]_i}, \quad \forall i = 1, \dots, d.$$

(General) mirror descent convergence statement

Since we changed norm in the space of the variable x, we need to go to the dual norms in the space of the subgradients

$$||y||_* := \max_{||x||=1} \{\langle y, x \rangle\}.$$

$\mathsf{Theorem}$

In $(\mathbb{R}^d,\|\cdot\|)$ and subgradients bounded in dual norm $\|g_k\|_* \leq G$, then

$$f(\bar{x}_k) - f^* \leq \frac{(\mathcal{D}(x^*, x_0))^{1/2} G}{\sqrt{k}},$$

where \bar{x}_k denotes the averaged iterates, as usual.

Convergence w.r.t. negative entropy

It might occur that

$$||g||_{\infty} = (||g||_1)_* \leq G$$

but

$$\|g\|_2 \approx \sqrt{d}G$$
.

But is are all the bounds of the previous theorem dimension independent?

What about $\mathcal{D}(x^*, x_0)$? Let $x_0 = (\frac{1}{d}, \dots, \frac{1}{d})$, then

$$\mathcal{D}(x,x_0) = \sum x_i \log \left(\frac{x_i}{\frac{1}{d}}\right) = \sum x_i \log(x_i) + \log(d) \leq \log(d)$$

while $||x_0 - x^*||^2 < 2$.

Proof

In the Euclidian space we used

$$\langle x_{k+1} - x_k, x^* - x_{k+1} \rangle$$

$$= \frac{1}{2} \|x^* - x_k\|^2 - \frac{1}{2} \|x^* - x_{k+1}\|^2 - \frac{1}{2} \|x_{k+1} - x_k\|^2.$$

Similar 3-point identity holds for Bregman distances:

$$\langle \nabla h(x_{k+1}) - \nabla h(x_k), x^* - x_{k+1} \rangle = = D(x^*, x_k) - D(x^*, x_{k+1}) - D(x_{k+1}, x_k).$$

Therefore

$$D(x^*, x_{k+1}) \leq D(x^*, x_k) - D(x_{k+1}, x_k) + \alpha \langle g_k, x^* - x_{k+1} \rangle.$$

Proof II

$$D(x^*, x_{k+1}) \le D(x^*, x_k) - D(x_{k+1}, x_k) + \alpha \langle g_k, x^* - x_{k+1} \rangle.$$

Last term is not quite right.

$$\langle g_{k}, x^{*} - x_{k+1} \rangle = \langle g_{k}, x^{*} - x_{k} \rangle + \langle g_{k}, x_{k} - x_{k+1} \rangle$$

$$\leq f(x^{*}) - f(x_{k}) + \|g_{k}\|_{*} \|x_{k} - x_{k+1}\|$$

$$\leq f(x^{*}) - f(x_{k}) + \frac{\alpha \|g_{k}\|_{*}^{2}}{2} + \frac{\|x_{k} - x_{k+1}\|^{2}}{2\alpha}.$$

Combined we get that

$$D(x^*, x_{k+1}) \leq D(x^*, x_k) - D(x_{k+1}, x_k) + \alpha(f(x^*) - f(x_k)) + \frac{\alpha^2 \|g_k\|_*^2}{2} + \frac{\|x_k - x_{k+1}\|^2}{2}.$$

Proof III

We assumed strong convexity of h:

$$D(x_{k+1},x_k) \geq \frac{1}{2}||x_{k+1}-x_k||^2.$$

Yields

$$D(x^*, x_{k+1}) \leq D(x^*, x_k) + \alpha(f(x^*) - f(x_k)) + \frac{\alpha^2 \|g_k\|_*^2}{2}$$

Continue as always

$$\frac{1}{k}\sum_{i=1}^k f(x_i) - f^* \leq \frac{D(x^*, x_0)}{\alpha k} \frac{\alpha G^2}{2}$$

What about the smooth case

- Talked about how to get better constants in the "bounded subgradients" setting
- but can't make them bounded if they are not

However,

Can also come up with a new notion of smoothness

$$f(y) \le f(x) + \langle \nabla f(x), y - x \rangle + LD(y, x)$$

which might hold even if f is not smooth in classical sense
